DESIGN FOCUS	**A clear, simple, and user-friendly ordering flow designed around students’ limited break time.**

University Canteen Food Pre-Ordering System

UI/UX Design Project Documentation

1. Project Overview and Problem Statement

1.1 Project Overview

The University Canteen Food Pre-Ordering System is a beginner-level UI/UX design project created using Figma. The project focuses on improving the food purchasing experience of university students by reducing the time they spend waiting in long queues at university canteens.

Students often have limited time between lectures and need a convenient way to purchase their meals. This project proposes a simple digital interface that allows students to view available food items, select their preferred meals, and place orders in advance.

Students can choose to collect their orders directly from the canteen or use a delivery service within the university premises. The main focus of the project is to design a clear, simple, and user-friendly interface that makes the food ordering process more convenient.

The project covers the initial UI/UX design stage, including wireframing, screen layouts, navigation, and the main user journey. The Figma wireframe provides a foundation for the future development of a functional food pre-ordering application.

1.2 Problem Statement

University students often face long queues at canteens, especially during lunch breaks and other busy periods. Since students have limited time between lectures, waiting in line to order food can waste valuable time that could be used for eating, resting, or preparing for the next lecture.

The traditional food purchasing process requires students to visit the canteen, wait to place their orders, and sometimes wait again while their food is being prepared. This can be inconvenient for students who have busy academic schedules.

Therefore, a more convenient approach is needed to help students order food in advance and receive it when it is ready.

The proposed University Canteen Food Pre-Ordering System addresses this problem by allowing students to select meals through a simple digital interface, place orders before reaching the canteen, and choose between canteen pickup and on-campus delivery. The design aims to reduce unnecessary waiting and improve the overall food purchasing experience within the university.

2. Proposed Solution, Aim, and Objectives

2.1 Proposed Solution

The proposed solution is a user-friendly food pre-ordering interface designed for university students. It allows students to explore the food menu, select their preferred meals, review their orders, and choose how they want to receive their food.

Instead of waiting in a queue to place an order, students can complete the ordering process through the proposed application. They can then collect their meals directly from the canteen or request delivery to a supported location within the university.

The design focuses on making the ordering process simple and understandable, even for users who are using the application for the first time.

2.2 Aim

The main aim of this project is to design a simple and user-friendly university canteen food pre-ordering interface that helps students save time by ordering food in advance and receiving their meals conveniently.

2.3 Objectives

The main objectives of the project are:

- To identify the problems students face when purchasing food from university canteens.
- To design an attractive and user-friendly interface using Figma.
- To provide a clear way for students to browse available food items.
- To allow students to select their preferred meals and review their orders.
- To design a simple ordering process that reduces unnecessary steps.
- To provide options for canteen pickup and delivery within the university.
- To design an interface that helps students understand their order progress and collection arrangements.
- To apply basic UI/UX design principles to improve usability and navigation.
- To create a wireframe that can be used as a foundation for future application development.

3. Intended Users

The primary intended users of the proposed system are university students.

3.1 University Students

University students are the main target audience because they often have limited time between lectures and other academic activities. They need a convenient way to purchase food without spending too much time waiting in canteen queues.

The system is designed to help students:

- View available food items and their prices.
- Choose meals according to their preferences.
- Place food orders in advance.
- Review selected food items before confirming an order.
- Choose between canteen pickup and on-campus delivery.
- Check the progress of their orders, where order status information is available.
- Use their break time more effectively.

3.2 User Needs

The design considers several important user needs:

- **Convenience:** Students should be able to order food without unnecessary effort.
- **Speed:** The ordering process should require as few unnecessary steps as possible.
- **Clarity:** Food names, prices, and order details should be easy to understand.
- **Flexibility:** Students should have a choice between pickup and delivery.
- **Ease of use:** The interface should be understandable for first-time users.

By focusing on these needs, the project aims to provide a better food ordering experience for university students.

4. Main User Journey

The main user journey explains how a student moves through the proposed interface from opening the application to receiving the ordered food.

Step 1: Open the Application

The student opens the application and views the landing or home screen, which introduces the service and guides them toward ordering food.

Step 2: Browse the Food Menu

The student explores the available food items and checks relevant details such as food names, images, and prices.

Step 3: Select Food

The student chooses a preferred meal and selects the required quantity before adding it to the order.

Step 4: Review the Order

The student checks the selected items, quantities, and total cost to ensure that the order is correct.

Step 5: Choose a Receiving Method

The student selects either direct pickup from the canteen or delivery to a supported location within the university.

Step 6: Confirm the Order

The student reviews the final order information and confirms the order through the proposed interface.

Step 7: Check Order Progress

The student views the available order status information to understand whether the food is being prepared or is ready.

Step 8: Receive the Food

The student collects the meal from the canteen or receives it through the university delivery service.

This journey is designed to make the food ordering process easier to follow and reduce the need to wait in a traditional queue to place an order.

5. Detailed Explanation of the Six Wireframe Sections

The six wireframe sections represent the main stages of the proposed food ordering experience. Each section has a specific purpose and supports the student in completing the ordering process.

5.1 Section One – Landing or Home Screen

Purpose: To introduce the application and guide students toward the food ordering process.

The landing or home screen is the starting point of the application. It should clearly communicate the purpose of the service and explain how it helps students order food conveniently.

The screen may contain the application name or logo, a welcoming message, food-related images, and a clear button that allows students to begin ordering.

The design should highlight the main benefit of the application: saving time by ordering food in advance.

The screen should be visually attractive but simple enough for users to understand without confusion.

5.2 Section Two – Food Menu Screen

Purpose: To allow students to browse available food items and choose their preferred meals.

The food menu screen displays the food items offered through the proposed service. Students can view the available options and compare them based on their preferences and budget.

Each food item may include an image, name, price, and a button to select the item. Categories or search options may also be included if they are part of the wireframe.

The layout should organize food items clearly so students can find what they want without spending too much time searching.

The main goal of this screen is to make food selection quick, simple, and convenient.

5.3 Section Three – Food Selection or Details Screen

Purpose: To help students review a selected food item before adding it to their order.

This screen provides additional information about the selected meal. Students can check the food name, image, description, and price before deciding whether to add it to their order.

A quantity selector and an add-to-cart button may also be included, depending on the wireframe design.

The screen should display important information clearly and provide an obvious next step. This helps students make informed choices and reduces confusion during food selection.

5.4 Section Four – Cart or Order Review Screen

Purpose: To allow students to review their selected food items before proceeding.

The cart screen displays the food items selected by the student. It allows the student to check the order and make changes before confirming it.

The screen may include food names, quantities, individual prices, and the total cost. Options to remove items or change quantities can also be included.

A clear button should guide the student to the next stage of the process.

This screen is important because it gives students an opportunity to verify their selections and avoid mistakes before submitting an order.

5.5 Section Five – Checkout and Pickup or Delivery Screen

Purpose: To allow students to review their final order and choose how they want to receive their food.

The checkout screen presents the final order details and provides the available receiving options.

Students can select direct canteen pickup or on-campus delivery. If delivery is selected, the interface may ask for the relevant university location and necessary contact information.

The screen should clearly display the order total and any other information required to complete the order.

The design should avoid unnecessary fields and complicated steps. A simple checkout process helps students complete their orders more conveniently.

5.6 Section Six – Order Status and Collection Screen

Purpose: To help students understand the progress of their orders and receive their food.

After confirming an order, students need information about its progress and when they can receive it.

This screen may display the order details, current status, and relevant pickup or delivery instructions. For example, the status information may indicate that an order is being prepared or is ready for pickup.

For pickup orders, the interface should guide students on where to collect their food. For delivery orders, it may display the available delivery information.

The purpose of this screen is to reduce uncertainty and help students plan when to collect or receive their meals.

The six sections together provide a clear path through the proposed food ordering process.

6. Key UI/UX Design Principles

The project applies basic UI/UX principles to make the interface simple, attractive, and easy to use.

6.1 Simplicity

The interface should avoid unnecessary information and complicated layouts. Students should be able to understand the main functions without needing detailed instructions.

6.2 Consistency

The same colours, typography, button styles, icons, and spacing patterns should be used throughout the screens. Consistency helps users become familiar with the interface.

6.3 Clear Navigation

Users should understand where they are in the ordering process and how to proceed to the next step. Important buttons should be easy to identify.

6.4 Visual Hierarchy

Important elements such as food images, prices, order totals, and primary action buttons should receive appropriate visual emphasis. This helps users identify relevant information quickly.

6.5 Ease of Use

The application should be easy to understand, especially for students using it for the first time. Familiar icons, understandable labels, and straightforward interactions can improve usability.

6.6 Efficiency

Since the main purpose is to reduce waiting time, the interface should minimize unnecessary actions and repetitive information entry.

6.7 Readability

Text should be readable, font sizes should be appropriate, and there should be sufficient contrast between text and background colours.

6.8 User Feedback

The interface should provide clear indications of important actions, such as adding food to the cart or confirming an order. Order status information should also be easy to understand.

6.9 Error Prevention

Students should be able to review their selected food items, quantities, and total cost before confirming an order. Clear labels and well-organized layouts can help reduce mistakes.

6.10 Responsive Design

The design should consider different screen sizes, particularly mobile phones, because students may want to order food while moving around the university.

7. Expected Benefits

The proposed system is expected to provide several benefits to university students.

7.1 Reduced Waiting Time

Students can place orders in advance instead of spending time waiting in a queue to place them. This may help reduce unnecessary delays during busy periods.

7.2 Better Time Management

Students can use their limited break time more effectively for eating, resting, studying, or preparing for their next lecture.

7.3 Greater Convenience

The digital interface provides a convenient way to browse food items and make selections without following the traditional ordering process.

7.4 Flexible Food Receiving Options

Students can choose between collecting their meals directly from the canteen and requesting delivery within the university, where the service is available.

7.5 Improved Ordering Experience

A clear and organized interface helps students understand food options, review their selections, and complete the ordering process with less confusion.

7.6 Better Order Awareness

The proposed order status screen can help students understand the progress of their orders and know when their food is ready.

7.7 Foundation for Future Development

The Figma wireframe provides a starting point for developing a functional food pre-ordering application in the future.

These are expected benefits of the proposed design. Their actual impact would need to be evaluated through usability testing and, eventually, practical implementation.

8. Project Scope and Conclusion

8.1 Project Scope

The scope of this beginner-level project is limited to the UI/UX design of a university canteen food pre-ordering system using Figma.

The project focuses on designing the main screens, organizing information, and creating a simple user journey that supports advance food ordering.

The project includes:

- Identifying the problem of long queues at university canteens.
- Identifying the main needs of university students.
- Designing six main wireframe sections.
- Creating a clear and understandable navigation flow.
- Presenting food items and their relevant details.
- Designing the food selection and cart review process.
- Providing a proposed checkout interface.
- Including pickup and on-campus delivery options.
- Designing an order status and collection interface.
- Applying basic UI/UX principles to improve usability.

The project does not include:

- Developing a fully functional application.
- Implementing a database or backend.
- Building a separate staff management interface.
- Implementing real-time notifications or delivery tracking.
- Integrating actual online payment services.

These functions may be considered in future development, but they are outside the main scope of the current wireframe project.

8.2 Conclusion

The University Canteen Food Pre-Ordering System is a beginner-level UI/UX design project that addresses the problem of long queues and wasted time at university canteens.

The proposed solution allows students to explore food options, select meals, review their orders, choose a receiving method, and view order progress through a simple digital interface.

The six wireframe sections provide a structured representation of the main user journey, from accessing the application to receiving the ordered food. By applying UI/UX principles such as simplicity, consistency, clear navigation, readability, and ease of use, the design aims to make the ordering experience more convenient for students.

Although the current project focuses on wireframing rather than software development, it provides a valuable foundation for future implementation. Overall, the project demonstrates how a user-centred design approach can be used to address a practical problem in the university environment and create a more convenient food purchasing experience.
